Act F.A.S.T. 2018

Facts & Stats

January 2018
Act FAST – Hero campaign statistics for press release

- There are more than 100,000 strokes in the UK every year\textsuperscript{i,ii}
- There are more than 80,000 hospital stroke admissions recorded in England, Wales and Northern Ireland each year\textsuperscript{ii}
- On average, there are around 40,000 stroke deaths in the UK each year\textsuperscript{iii,iv,v} (32,000 in England each year)\textsuperscript{vi}
- There are around 1.2 million stroke survivors in the UK\textsuperscript{vii,viii,ix,x} (over 1 million of those in England)\textsuperscript{xii}
- Almost two-thirds of stroke survivors leave hospital with a disability\textsuperscript{xii, Error! Bookmark not defined.}
- While the majority of people (93%) would call 999 if they saw a stroke, a quarter (24%) incorrectly think that they need to see two or more signs before making the call\textsuperscript{xiii}

Additional campaign statistics for toolkit and Q&A

Key statistics:

- Stroke is one of the largest causes of complex disability – over half of all stroke survivors have a disability\textsuperscript{xiv,xv}
- Stroke is the fourth single largest cause of death in the UK\textsuperscript{iii,iv,v}
- Stroke kills twice as many women as breast cancer and more men than prostate and testicular cancer combined a year\textsuperscript{iii,v}
- Black people are twice as likely to have a stroke at a younger age compared to white people\textsuperscript{xvi}
- Stroke has a greater disability impact on an individual than any other chronic disease\textsuperscript{xvii}
- Over a third of stroke survivors in the UK are dependent on others, of those 1 in 5 are cared for by family and/or friends\textsuperscript{xviii}

Frequency:

- Due to an ageing population, the rate of first time strokes is expected to increase by 59% in the next 20 years for people aged 45 and over\textsuperscript{xix}
- In the same period, the estimated number of stroke survivors is expected to rise by 123%, for people aged 45 and over\textsuperscript{xix}
- 1 in 4 stroke survivors will experience another stroke within five years\textsuperscript{xx}
- Men are at a 25% higher risk of having a stroke at a younger age compared to women\textsuperscript{i,xxi}
- However, as women live longer there are more total incidences of stroke in women
- The greatest risk of recurrent stroke is in the first 30 days\textsuperscript{xxii}
- Strokes often happen following a TIA or a mini stroke. Of all strokes than occur after TIAs about half of them happen in the following 24 hours\textsuperscript{iii} and 8% will occur within a week of a TIA\textsuperscript{xxiii}
Mortality:

- One in eight strokes are fatal within the first 30 days

- In England and Wales alone, stroke killed 18,750 women and 13,877 men in 2016

- Stroke is the fourth single largest cause of death in England and Wales

- 1 in 14 (6%) of all deaths in the UK is caused by stroke

  - Stroke causes approximately 6% of all deaths in men in the UK

  - Stroke causes approximately 7% of all deaths in women in the UK

- Over 40,000 people died of stroke in the UK in 2016.

- Lower mortality rates in the UK means there are more people surviving and living with stroke now than ever before

Age:

- Age is the single most important risk factor for stroke

- The risk of having a stroke doubles every decade after the age of 55

- Men are at higher risk of having a stroke at a younger age than women.

- 1 in 4 (26%) of strokes in the UK occur in people under 65 years old

Effects of stroke:

- Stroke causes a greater range of disabilities than any other condition

- The effects of a stroke depend on where it takes place in the brain and how big the damaged area is

- Stroke can affect walking, talking, speech, balance, co-ordination, vision, spatial awareness, swallowing, bladder control and bowel control

Risk factors:

- High blood pressure can triple your risk of stroke and heart disease. The prevalence of high blood pressure in England is 13.8%

- The number of people diagnosed as having high blood pressure has consistently increased since 2005

- Diabetes (type 1 and type 2) almost double your risk of stroke and is a contributing factor to 20% of strokes in England, Wales and Northern Ireland

- Obese people are 80 times more likely to develop type 2 diabetes than people with a BMI under 22

- Regular consumption of large amounts of alcohol greatly increases your risk of ischaemic stroke
• One study found that heavy drinking (considered as more than two drinks per day) was found to shorten the time to stroke by 5 years\textsuperscript{xxxviii}

• Smoking doubles your risk of death from stroke\textsuperscript{xxxix}

**Treatment:**

• 51.3% of stroke patients in England, Wales and Northern Ireland have a brain scan within one hour of admission, and 90% within 12 hours of admission\textsuperscript{xl}

• An estimated 1.9 million neurons are lost every minute a stroke is untreated\textsuperscript{xli}

• More than half of patients who received the clot busting treatment, thrombolysis, in the UK received it within an hour of arriving at hospital in 2016-17\textsuperscript{i,xlii}

• 85% of all stroke patients that are eligible for thrombolysis receive it\textsuperscript{xlii}

• The average time between arriving at hospital and receiving thrombolysis was 52 minutes in 2016/2017, which represents a reduction of 6 minutes since 2013/2014\textsuperscript{xliv}

• Patients treated with thrombolysis quicker have better outcomes. When thrombolysis is given within 3 hours, 2% more patients will be alive and able to return to their lives without added assistance\textsuperscript{xlv}

• For every 1,000 patients treated with thrombolysis within three hours, about 100 more will be alive and live independently than 1,000 patients not treated with thrombolysis\textsuperscript{xlvi}

**Acting FAST:**

• Since 2009, public awareness has moved on and our tracking shows that people are now more aware of the signs of stroke – with 78% of people spontaneously recognising at least one of the signs of a stroke following last year’s campaign (prompted recognition was 99%).

• This is backed up by recent qualitative research that showed people are now more aware of what a stroke is,\textsuperscript{xlvii} with most aware that it occurs in the brain – and is related to the flow of blood. Most people are also aware of at least one of the signs – with word of mouth driving awareness for many

• 85% of people know that if detected early, stroke can be effectively treated in many cases\textsuperscript{xlviii}

• When prompted:\textsuperscript{xlix}
  - 97% of people recognised that a face fallen on one side could be a sign of stroke
  - 95% recognised slurred speech
  - 92% recognised someone being unable to lift their arm

• However, 13% erroneously wouldn’t call 999 if they weren’t sure if someone was showing signs of having a stroke
